

Ideal: The HotSpot Server Compiler Node Hierarchy

v1.1, 2015-04-21

Michael Haupt, HotSpot Compiler Group, Oracle

- Notes:**
- All node classes without an inheritance link inherit directly from Node.
 - Not all node classes are represented by boxes; some classes mention some of their subclasses in the form of a list.
 - The class name lists sometimes use curly braces to denote multiple possibilities; e.g., `Mul{D,F}Node` implies there are classes named `MulDNode` and `MulFNode`.
 - Node classes represented by white boxes are too generic to be assigned any given role.
